RESULT
                                                         This sequence represents the heavy chain variable region (VH) of murine anti-CD23 (FCBRII) monoclonal antibody C11. The invention provides anti-CD23 (FCBRII) monoclonal antibody C11. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAY32262 and AAY32263), which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on heamatopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus expthematious, psoriasis, urticaria, meltiple sclerosis, diabetes, uveltis, dermatitis, psoriasis, urticaria, mephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, croim's disease, Slogren's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic axacerbation, rhinitis, eczema, graftversus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            302

The present invention relates to new antibodies that specifically bind a novel prostate stem cell antigen (PSCA), which is widely over-expressed across all stages of prostate cancer. The antibodies of the invention are useful to kill tumour cells expressing PSCA and as PSCA expression is observed in prostate tumour cells and in other human cancers, particularly bladder and pancreatic carcinomas, the antibodies are useful therapeutically to threat these diseases. In particular, monoclonal antibodies can be administered to subjects suffering from PSCA-associated cancers, e.g. prostate, bladder or pancreatic cancer or metastatic prostate, bladder or pancreatic cancer, or metastatic prostate, bladder or pancreatic cancer, or inhibit the cancer and prolong the subject's life. The antibodies can be combined with a therapeutic agent in immunoconjugates useful to treat subjects suffering from

malignant diseases, characterised by cells having FSCA antigen on the cell surface e.g. cancers, by killing the cells. The antibodies and commonconjugates may also be included with a carrier in pharmaccutical compositions useful to kill human cells expressing PSCA antigen on the cell surface. The antibodies are also useful diagnostically to detect cancers, especially prostate cancer, to isolate prostate cancer cells e.g. to enable culture growth to evaluate candidate therapeutic compounds, assist in identification of rare genes associated with prostate cancer, and to isolate and purity PSCA and PSCA homologues. The present amino acid sequence represents the mouse heavy chain variable domain region of the PSCA monoclonal antibody 2H9 of the invention
                                                                                                                                                                                                                                                                                                                                                  92

The present invention describes a method of treating cancer associated with prostate stem cell antigen (PSCA) by administering an antibody which selectively binds to PSCA and inhibits the growth of the cancer cells. The PSCA gene is found on human chromosome 8Q24.2. The invention provides the human and murine PSCA protein and coding sequences, which can be used not only in the treatment of, but also in detection and prognosis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The heavy chain variable region (AAW06212) of mouse monoclonal antibody Br-3 is the product of a cDNA clone (AAT3437) isolated from a Br-3 hybridoma cDNA library. MAD Br-3 (IGG1) binds to an antigen that is expressed on the surface of human lung, breast, colon and ovary carcinomas, but not on most normal adult tissues. The heavy chain and light chain variable regions (see also AAW06211) of B38-1 can be linked to human constant regions and expressed in transformed host cells. Novel mouse-human chimeric antibodies (see also AAW06209-10 and AAW06213-18) can be produced that have specificity to human tumour antigens and can be used for the treatment and diagnosis of human cancer. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence represents the heavy chain variable region of murine antibody Br-3. The sequence was used to create chimeric mouse-human immunoglobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody ING-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytotoxicity to target cells. The chimeric antibodies can be used for therapeutic purposes in the treatment of human cancer. (Updated on 20-MAR-2003 to correct PR field.)

The invention describes an antibody comprising a human constant region and a variable region having specificity for the human tumour antigen bound by the InG-1 antibody, where the ING-1 is produced by cell line is 199812 as deposited with ATCC, and the antibody has the same affinity as the ING-1 for the human tumour antigen. The antibody is useful in an immunoassay method for detecting an antigen in a sample by contacting at label and relating the detected label to the presence of the antigen; for use in an immal by contacting the presence of a label-detectable attigen in the sample with the artibody, detecting the attigen in an animal by contacting the antibody with a part of the antigen; cuse in an immal by contacting the cattering the label and relating the cells attigen in an antigen by contacting the cattering the label and relating the carting an antigen by contacting the cattering the antibody with a part of the antigen; carting an antigen by contacting the cattering the antibody and relating the killing to occur. The antibodies are useful in tumour allowing the killing to occur. The antibodies bind to the surface of human tumour cells but do not bind detectably to normal cells, e.g., fibroblasts, endothelial cells or epithelial cells in the major organs. The high biological activity of the chimeric antibodies against thuman tumour cell lines combined with minimal reactivity with normal tissues of malignant tissue. The presence of human rather than murine mabs: This creatisance to caparance thousances the potential utility of these chimeric antibodies, as well as their derivatives; in tumour diagnosis and the chimeric antibodies, in tumour diagnosis and the chimeric determinable region used in the creation of an anti-human tumour antigen-
                                                                Antibody for detecting antigen in animal or killing cells carrying antigen comprises human constant region and variable region having specificity for human tumor antigen bound by ING-1 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1100071

The chimeric antibodies can be used for any purpose for which the original murine MAbs can be used, with the advances that they are more compatible with the human body. They are esp. used for the diagnosis and treatment of cancer. (Updated on 25-MAR-2003 to correct PA field.)

```
This is the heavy-chain variable (V) region of a mouse mono- clonal antibody (MAb), 1C11, and is specific for an HIV-1 viral antigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV. See also AAQ12056-59 and AAQ12061. These novel sequence are useful in treatment, diagnosis and prophylaxis of HIV infections, and may be produced by a bacterial, yeast or mammalian expression system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This amino acid sequence represents the heavy chain of humanised anti-
CD23 (FCERII) monoclonal antibody C11, composed of a human framework
(HSIGKVII) and the heavy chain complementarity determining regions (see
AAY32257-59) of murine antibody C11. The DNA was constructed by splice
overlap PCR. The invention provides altered antibodies, such as chimeric
or humanised antibodies, which comprise sufficient of the amino acid
sequences of the C11 light and heavy chain complementarity determining
regions to render them capable of binding to the CD23 type II molecule
expressed on haematopoietic cells. The antibodies are used to block
soluble CD23 formation in human therapy, for the treatment of arthritis,
lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis,
diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80
                                                                                                                                                                                                          Primers JO2, JO3, JO4, JO14 and VHIBACK (AAQ62740-Q62744) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primers JO2, JO3, JO4, JO14 and VHIBACK (AAQ62765-Q62769) were all used to prepare CDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the mutine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. (Updated on 25-MAR-2003 to correct PN field.)

NAME OF THE PROPERTY SEASON OF THE PROPERTY OF

```
This sequence represents the heavy chain of the antibody ABX-CXL. The invention relates to a monoclonal antibody (MAb) with an isotype that itses complement and a variable region that binds to the epitope on CD147 bound by the IgM MAb ABX-CBL, providing that the antibody is not CBLI. The MAb can selectively kill activated T-cells, activated B-cells or resting or activated monocytes. The products and methods can be used for treating diseases involving activated T-cells or B-cells or monocytes, e.g. graft versus host disease (GVHD), organ transplant rejection diseases (e.g. renal transplant, ocular transplant), cancers (e.g. anners of the blood (e.g. leukaemia's and lymphomas) and pancreatic), arthritis)
                                                                                     329
                                                                                                                                                                                                                                                     330 TACCTGCAAATGAACAGCTTAAGAGCTGAAGACAGTGGAGTTTATTACTGTACA---GAT 386

or New modified anti-prostate specific membrane antigen (PSMA) immunoglobulins, useful for treating or preventing a prostatic or cancerous disorder, e.g. genitourinary inflammation, prostatits, prostatic or testicular cancer.

The present invention relates to modified (e.g. deimmunised) antibodies are less immunogenic compared to the unadified anti-PSVA antibodies are less immunogenic compared to the unmodified anti-PSVA antibodies. The modified antibodies complementarity determining regions (CDRs) from a non-human antibody (e.g. murine antibody J591, J415, J53 or B99), and framework sequences that are less immunogenic in humans (e.g. less antigenic than the murine frameworks in which a murine CDR human PMSA, with high affinity and specificity. The anti-PMSA antibodies are useful for treating or preventing a prostatic or cancerous disorder, e.g. genitourinary inflammation, prostatitis, benign enlargement, prostatic cancer or testicular cancer, or solid tumours, soft tissue tumours or metastatic lesions, and its associated pain. The present sequence represents a variable region from a murine antibody 206 266 326 386 20 40 9 80 TCCTGTGTAGCCTCTGGATTTACTTTCAGTGGCTACTGGATGTCTTGGGTCCGCCAGTCT CTCTACCTGCAAATGAACAGCTTAAGAGCTGAAGACAGTGGAGTTTATTACTGTACAGAT CCAGAGAAGGGGCTTGAGTGCTGAAATTAGATTGAAATCTGATAATTATGCAACA CATTATGCGGAGTCTGTGAAAGGGAAGTTCACCATCTCAAGAGATGATTCCAAAAGTCGT 61 HisTyrAlaGluSerValLysGlyArgPheThrIleSerArgAspAspSerLysSerSer 123 98 6 5 Length:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

Patent No. 6054561

GENERAL INFORMATION:
APPLICANT: RING, DAVID B.

TITLE OF INVENTION: ANTIGEN-BINDING SITES OF ANTIBODY
TITLE OF INVENTION: MOLECULES SPECIFIC FOR CANCER ANTIGENS
NUMBER OF SEQUENCES: 33
CORRESPONDENCE ADDRESS:
ADDRESSES CHIRON CORPORATION
STREET: INVELECTUAL PROPERTY - R440, PO BOX 8097
CITY: BMERYVILLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COUNTRY: USA

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

A, Molecule type: protein
A, Residues: 1-112 < RUD>
C, Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine. 7
C, Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine. 7
C, Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kapp hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into lan C; Superfamily: immunoglobulin V region; immunoglobulin homology
E, Reywords: heterotetramer
F; 16-95/Domain: immunoglobulin homology < IMM>
F; 23-93/Disulfide bonds: #status predicted
